1 Introduction

1.1 Purpose of the document

Based on module AT command manual, this document will introduce HTTP(S) application process. Developers could understand and develop application quickly and efficiently based on this document.

1.2 Related documents

[1] SIM7500_SIM7600 Series_AT Command Manual

1.3 Conventions and abbreviations

Abbreviation	Description
HTTP	Hyper Text Transfer Protocol
HTTPS	Hyper Text Transfer Protocol over Secure Socket Layer

2 HTTP Introduction

HTTP (HyperText Transfer Protocol) is an application layer protocol. When you browse a web page, the browser and the web server will send and receive data on the Internet through the HTTP protocol. HTTP is a stateless protocol based on request and response patterns. That is what we usually call Request/Response.

2.1 Characteristic

➤ Support client/server mode;

✧ Simple and fast

When a client requests a service from a server, it only needs to pass the request method and path. Because the HTTP protocol is simple, the program size of the HTTP server is small, and the communication speed is fast.

✧ Flexible

HTTP allows the transfer of any type of data object. The type being transferred is marked by Content-Type;

✧ No connection

No connection means limiting the processing of only one request per link. After the server processes the client's request and receives the customer's response, the server disconnects the link. This way, the transmission time can be saved.

✧ Stateless

The HTTP protocol is a stateless protocol. Stateless means that the protocol has no memory for transaction processing. A lack of state means that if subsequent processing requires the previous information, it must be retransmitted, which may result in an increase in the amount of data transferred per connection. On the other hand, it responds faster when the server does not need previous information.

2.2 Request Method

According to the HTTP standard, HTTP requests can use a variety of request methods.

HTTP 1.0 defines three request methods: the GET, POST, and HEAD methods.

HTTP1.1 adds six new request methods: OPTIONS, PUT, PATCH, DELETE, TRACE, and CONNECT

methods.

No	Method	Description
1	GET	Make a request to a specific resource.
2	HEAD	Ask the server for a response that is consistent with the GET request, except that the response body will not be returned. This method can obtain the meta information contained in the response message header without having to transmit the entire response content.
3	POST	Submit data to a specified resource for processing requests (such as submitting a form or uploading a file). The data is included in the request body. POST requests may result in the creation of new resources and/or modifications to existing resources.
4	PUT	Uploads its latest content to a specified resource location.
5	DELETE	Requests the server to delete the resource identified by the Request-URI.
6	CONNECT	H The HTTP/1.1 protocol is reserved for proxy servers that can connect connections to pipes.
7	OPTIONS	Returns the HTTP request method supported by the server for a particular resource. You can also test the functionality of the server by sending a '*' request to the web server.
8	TRACE	Echoes requests received by the server, primarily for testing or diagnostics.
9	PATCH	It is a supplement to the PUT method for local updating of known resources.

The SIM7500/SIM7600 series supports several methods: GET, POST, PUT, PATCH and HEAD.

3 AT Commands for HTTP(S)

Command	DESCRIPTION
AT+HTTPPARA	Set HTTP(S) Parameter
AT+HTTPINIT	Start HTTP(S) service
AT+HTTPACTION	HTTP Method Action
AT+HTTPHEAD	Read the HTTP Header Information of Server Response
AT+HTTPREAD	Read the response Information of Server Response
AT+HTTPDATA	You can use AT+HTTPDATA to input data to post when you send a HTTP/HTTPS POST request
AT+HTTPPOSTFILE	Send HTTP request in a file via AT+HTTPPOSTFILE command
AT+HTTPREADFILE	Receive HTTP Response Content to a file
AT+HTTPTERM	Stop HTTP service.

For detail information, please refer to “SIM7500_SIM7600 Series_AT Command Manual” .

4 Bearer Configuration

Usually module will register PS service automatically.

4.1 PDN Auto-activation

// Example of PDP Auto-activation.

AT+CPIN?

+CPIN: READY

// Check SIM card status

OK

AT+CSQ

+CSQ: 27,99

// Check RF signal

OK

AT+CGREG?

+CGREG: 0,1

// Check PS service

OK

AT+COPS?

+COPS: 0,0," CHINA MOBILE",7

// Query Network information, operator and network mode 7, LTE network

OK

5 HTTP(S) Samples

5.1 HTTP Function

5.1.1 HTTP GET

// Following commands shows how to send a HTTP GET request to server, and how to read HTTP response.

```

AT+HTTPINIT                                     // start HTTP service, activate PDP context
OK
AT+HTTPPARA="URL","http://opinion.people.      // set the URL which will be accessed, for HTTP,
com.cn/GB/n1/2018/0815/c1003-30228758.htm    the request URL begins with "HTTP://"
I"
OK
AT+HTTPACTION=0                                // send HTTP GET request
OK

                                                // 22505 is the length of HTTP response
+HTTPACTION: 0,200,22505                      information

AT+HTTPHEAD                                     // read the HTTP response header
+HTTPHEAD: DATA,387
